

IRON DRIVE

How It Works:

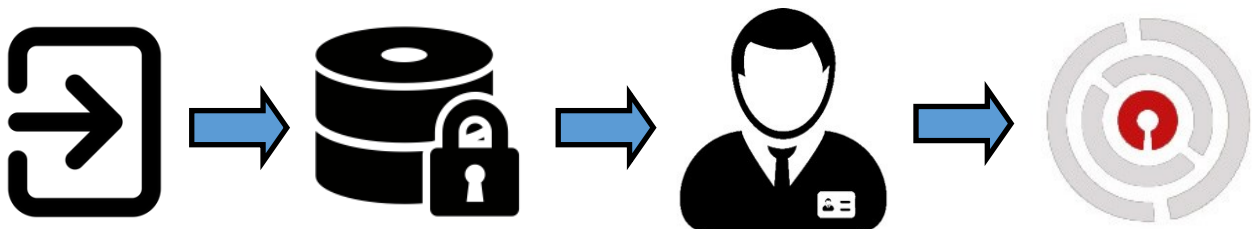

An Iron Drive session is initiated by the user. The Iron Drive storage media will be pulled from offline storage by an archive technician and attached to a secure server.

A custom URL will be sent to the user. The user will use that URL along with predefined credentials to access the file manager of the Iron Drive and transfer archived material via SSL to the Iron drive.

When the session is complete, the user will log out of the file manager. Once log out is complete an archival technician will detach the drive and place the drive into secure, off line storage.

All data on the Iron Drive is encrypted while at rest in offline storage.
